```
$ node /srv/forge-share/AI_Stuff/Athena/dist/cli.js --help
```

Usage: athena [options] [command]

Project scanner and manifest generator for AI-assisted development

Options:

-V, --version	output the version number
-h, --help	display help for command

Commands:

generate [options]	Scan a project directory and generate a project-manifest.json
generate-docs [options]	Generate documentation (README, ARCHITECTURE, API, DEPLOYMENT, CONTRIBUTING) using Claude API
changelog [options]	Generate CHANGELOG.md (and optionally HISTORY.md) from git history
init [options]	Initialize athena.config.json in a project directory
check [options]	Check if docs are stale (exit 1 if stale, for CI integration)
stamp [options]	Record current source file hashes (run after doc generation to mark docs as fresh)
watch [options]	Watch project source files and flag when docs become stale
schedule [options]	Show cron expression for scheduling periodic doc regeneration
capture-cli [options]	Auto-capture CLI tool output as SVG screenshots (detects commands from package.json, bin, athena.config.json)
diagrams [options]	Generate Mermaid architecture diagrams from code analysis (dependency graph, ER diagram, API flow, component tree, file structure, data flow)
screenshots [options]	Capture web app screenshots using Playwright (auto-discovers routes, supports themes/viewports)
render-html [options]	Convert markdown docs to a styled HTML site with sidebar navigation, dark theme, and embedded diagrams
help [command]	display help for command

What is this?

Athena automatically generates and updates your project documentation by analyzing your codebase. Instead of letting your docs get stale while your code evolves, Athena uses AI to write clear, accurate documentation that reflects what your project actually does right now. It's perfect for maintainers who want great docs without the manual effort.

                        sidebar navigation, dark theme, and embedded diagrams
help [command]          display help for command
```

All available Athena commands - generate docs, check freshness, create diagrams, and build changelogs

```
$ node /srv/forge-share/AI_Stuff/Athena/dist/cli.js --version
```

```
1.0.0
```

Check your installed Athena version

Quick Start

1. Install Athena

```
npm install -g athena
```

2. Set up your API key (Athena uses Claude AI)

```
export ANTHROPIC_API_KEY=your_api_key_here
```

3. Generate documentation for your project

```
cd your-project  
athena generate
```

4. **Check your new docs** - Look for generated markdown files in your project directory

5. **Keep docs fresh** - Run `athena freshness` anytime to check if your docs are out of sync with your code

How to Use

Generate Documentation

Run `athena generate` in your project root. Athena will scan your codebase, analyze the structure, and create comprehensive documentation. It automatically detects your project's language and framework.

Check Documentation Freshness

As you change your code, run `athena freshness` to see if your documentation is still accurate. Athena compares your current codebase against what's documented and highlights what's changed.

Create Architecture Diagrams

Use `athena diagram` to automatically generate visual representations of your project's structure. Great for onboarding new team members or planning refactors.

Build Changelogs

Run `athena changelog` to generate a changelog from your git history. Athena analyzes commits and tags to create a readable summary of what's changed between versions.

Capture Screenshots

If your project has a UI, use `athena screenshots` to automatically capture screenshots of key screens. These get embedded in your documentation.

Features

- **Automatic documentation generation** - Write docs by running one command
- **Freshness checking** - Know when your docs are out of sync with code changes
- **Multi-language support** - Works with TypeScript, JavaScript, and detects frameworks automatically
- **Architecture diagrams** - Visualize your project structure with auto-generated diagrams
- **Screenshot capture** - Automatically grab UI screenshots for documentation
- **Changelog generation** - Build changelogs from git history
- **AI-powered writing** - Uses Claude AI to write clear, human-friendly documentation
- **Configurable** - Customize what gets documented and how with an `.athena.json` config file
- **Git-aware** - Integrates with your repository for changelogs and change detection

Installation

Prerequisites

- Node.js 18 or higher
- An Anthropic API key ([get one here](#))
- Optional: Mermaid CLI for diagram rendering (`npm install -g @mermaid-js/mermaid-cli`)
- Optional: Playwright for screenshot capture (installs automatically with Athena)

Install globally

```
npm install -g athena
```

Or use with npx (no installation needed)

```
npx athena generate
```

Set up your API key

Athena needs access to Claude AI. Set your API key as an environment variable:

```
export ANTHROPIC_API_KEY=your_api_key_here
```

Or add it to your shell profile (`.bashrc` , `.zshrc` , etc.) to make it permanent:

```
echo 'export ANTHROPIC_API_KEY=your_api_key_here' >> ~/.zshrc
```

Configuration

Create an `.athena.json` file in your project root to customize behavior:

```
{
  "include": ["src/**/*.ts", "lib/**/*.js"],
  "exclude": ["/*.test.ts", "dist/"],
  "outputDir": "docs",
  "diagramFormat": "mermaid"
}
```

Configuration options:

- `include` - Glob patterns for files to scan (default: all code files)
- `exclude` - Glob patterns to ignore (default: node_modules, test files)
- `outputDir` - Where to write generated docs (default: project root)
- `diagramFormat` - Diagram format preference (default: mermaid)

Tech Stack

Built with modern TypeScript tools:

- **TypeScript** - Type-safe codebase
- **Commander** - CLI interface
- **Anthropic SDK** - Claude AI integration for documentation generation
- **Playwright** - Automated screenshot capture
- **Glob** - File pattern matching for codebase scanning
- **Diff** - Change detection for freshness checking
